*Helpful email Recourses: LOCALIZING*

---

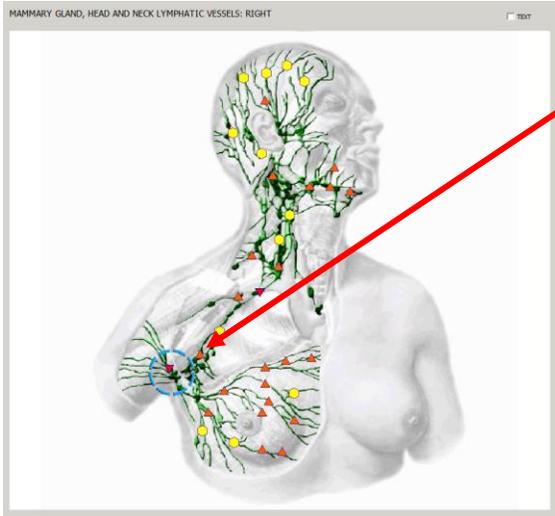

I want to understand localize better. I notice that in an organ the areas that seem to be veins or arteries are 6s. So if I localize that area, then what, analyze, then what? Does it do metatherapy on that highlighted area only?

Localizing is best used when you have a scan with 1 or 2 “abnormal” energy levels compared to the rest.

Here we can see all energy looks okay except in 2 places. So I can pick one and localize it.

SO I will choose one and analyze it

I choose the spot closer to the armpit to Localize.

After Localizing you can see the graphs of both are different so see if analysis shows anything new or different.

We do not talk a lot about localizing because it is not always helpful or shows anything different.

The body is just too connected and Oberon does a good job of picking things up normally.
